Summary

Senior Software Engineer with 3+ years building production backend systems at Gainsight: high-throughput APIs, distributed services, authentication, observability, and infrastructure-as-code. Currently leading enterprise readiness for Fortune 500 deployments.

Experience

Gainsight — Hyderabad, India — August 2022 -- Present

Promoted twice: Associate Software Engineer → Software Engineer → Senior Software Engineer.

Senior Software Engineer — Aug 2025 -- Present

- Drove enterprise readiness (SLA, scale, security review) to unblock Fortune 500 deployments at Intuit and Adobe.
- Promoted previously-internal APIs to public endpoints; designed authentication, authorization, scoped permissions, and per-tenant rate limiting before launch.
- Remediated critical Python CVEs flagged by Snyk: triaged severity, upgraded transitive dependencies, validated no regressions before release.

Software Engineer — Aug 2023 -- Aug 2025

- Scaled backend APIs to seven-figure peak requests per second at sub-50ms P99 latency via horizontal scaling and a distributed caching layer in front of hot endpoints.
- Engineered Single Sign-On across the multi-product platform, replacing per-product login flows with a centralized identity layer.
- Operated observability (metrics, logs, distributed tracing) for microservices and AI workloads at 99.9% uptime; built a user segmentation pipeline across millions of users for targeted campaigns.

Associate Software Engineer — Aug 2022 -- Aug 2023

- Automated infrastructure provisioning across microservices with Terraform (IaC), cutting deployment time by roughly 30% and removing manual error-prone steps.
- Built unit, integration, and end-to-end test suites and Docker-based Python dev environments, reducing onboarding and debug cycles.
- Led platform internationalization (i18n), unblocking localization for non-English markets.

Projects

AWS RL Environment — Python, FastAPI, OpenEnv, MiniStack, HuggingFace

- Built a reproducible RL training environment around a vendored MiniStack simulator (34 AWS services, no cloud cost): 120+ YAML-defined tasks across 5 difficulty tiers, an 8-way parallel rollout pool on a single GPU, and an 8-layer anti-reward-hacking defense stack covering verification, dedup, command allow-listing, monotonic progress, and exact resource matching.

LeetCode Companion — React, TypeScript, FastAPI, Server-Sent Events, crawl4ai, Docker

- Full-stack tutoring service at leetcode.udaykp.dev: FastAPI backend with crawl4ai-based problem extraction, React + TypeScript frontend over Server-Sent Events for chunk-by-chunk streaming, packaged for one-command Docker Compose deploy.

Technical Skills

Languages: Python, TypeScript, SQL

Backend & APIs: FastAPI, Node.js, REST, Server-Sent Events, Microservices, Event-Driven Architecture

Cloud & Infrastructure: AWS, GCP, Docker, Terraform, CI/CD

Data & Caching: PostgreSQL, Redis, MongoDB

Security & Observability: OAuth, Single Sign-On, Snyk CVE remediation, Metrics, Logs, Distributed Tracing

Education

Sagi Rama Krishnam Raju Engineering College — Bhimavaram, Andhra Pradesh — June 2018 -- July 2022

Bachelor of Technology in Electronics and Communication

Achievements

LeetCode Weekly Contest 393: Rank 233 worldwide out of ~25,000 participants; profile leetcode.com/u/IamUday.

Smart India Hackathon: 6th place nationally; led a 4-person team out of 100+ teams shipping a real-time accessibility app under a 36-hour build window.
